

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

V. *An Account of a luminous Arch. In a Letter from the Rev. Mr. B. Hutchinson to Sir Joseph Banks, Bart. P. R. S.*

Read December 14, 1786.

S I R,

Kimbolton, Feb. 24, 1784.

LAST night (Monday 23.) at nine o'clock, a very uncommon aurora borealis appeared here. When I was called down to see it, it had formed a perfect, uniform semicircle, of the apparent breadth of half a yard, reaching like the rainbow (which it entirely resembled, only that its colour was simple), from the W.S.W. horizon to that of the E.N.E. Some of the brightest stars of the Bull only just could be seen through it. The whole hemisphere was without a cloud; calm; the wind had gone down at west; a slight frost, after a warm thaw, was taking place; and, what was most extraordinary, there was no other aurora borealis in the heavens till this began to fade away, which then, however, arose a little, due N., but without any streamers; the ring had no vibratory motion. If this phenomenon should have luckily been observed at London or Greenwich, *data* may be had to determine its height from the earth.

With this view I ran for my quadrant, and found its zenith distance on the meridian south 11 degrees. Kimbolton is 63 miles N.N.W. of London, latitude $52^{\circ} 20'$.

I have the honour to be, &c.

B. HUTCHINSON.
